What is rpm in a drill rig?

RPM: In drilling terms, it is the revolutions per minute of the drill string provided by the drill rig's rotation head. The required RPM is again determined by the material being drilled and drilling method. Auger drilling for geothermal applications generally requires rotation speeds of 40 to 90 RPM.

How much pullback does a drill rig need?

For example, a drill rig such as the K60 having 22,000 lbs of pullback at 50 percent capacity will retract 137 drill rods, 10 ft long, weighing 80 lbs each (in other words, a drill string of 1,370 ft). Pullback is vital in determining depth capacity as the rig must have sufficient power to be able to retract the drill string.

How much weight does a rotary bit drill need?

Mud rotary bits drilling in soft formations are run with lower weight (1,100 to 3,000 lbs per inch of bit diameter) than harder formations which can require up to 5,000 lbs per inch of bit diameter. As more weight/drill pipe is added to the drill string, less pushdown is required from the rig.
