

How to connect the inlet and outlet pipes of screw air compressor

How to install a screw air compressor?

The installation of a screw air compressor can be divided into four aspects: environmental requirements, ground placement requirements, piping installation, and electrical safety considerations. 1. The air compressor should be installed in a surrounding environment that is cool, has low humidity, and is relatively dust-free.

How far should airdrops be from a compressor?

The first airdrop should be about 50 ft away from the compressor for optimal performance. Multiple air users should not be connected to the same drop, each drop should be used for a single air user. Incorporate drain valves, they help the system dispose of any contaminants that build up especially during heavy use.

How do I ensure ventilation in a compressor room?

You may also ensure ventilation through alternatives such as: Forced ventilation with an exhaust fan: Install an exhaust fan if the temperature inside the compressor room exceeds 41 °F. Forced ventilation with ducts: Ensure the hot air exhaust from the compressor is diverted through ducts when it is installed in an enclosed area.

What if you use an unsuitable material in an air compressor piping diagram?

It is very important, if not essential, to recognize that using an unsuitable material in an air compressor piping diagram can lead to mechanical failure, damages, or even severe injury and potential deaths. The diameter of the pipes is an important parameter to consider as this can significantly affect the pressure of the air.

How can I improve the efficiency of my air compressor piping system?

Implementing a couple of best practices into the design of your air compressor piping system layout will go a great distance. This will reduce the pressure drop issue in the system and hopefully extend its life. The following tips can help improve the efficiency of your air compressor piping system.

How to remove moisture from air compressor piping?

One technique would be changing the supply inlet from the bottom to the top of the compressor, to help reduce the moisture. Another would be using an aftercooler, they can remove above 50% of the liquid in an air compressor piping diagram. It must be noted, that it is impossible to keep any air compressor system free of moisture.
