How do you troubleshoot a rotary screw compressor?

Effective troubleshooting involves identifying the symptoms, understanding the potential causes, and applying the appropriate corrective actions. This essay explores common problems with rotary screw compressors and offers detailed troubleshooting guidance for each issue. 1. Compressor Not Starting

How does a screw compressor work?

A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand. The inlet valve is controlled by a solenoid valve that supplies control air to the inlet/loading valve. Check solenoid valve coil and solenoid valve operation.

Why does my compressor trip on over temperature?

If your compressor trips on over temperature, it could be any of the following: Ambient temperature too high or not enough ventilation. A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand.

What should I do if my air compressor is too low?

If the capacity of the air compressor is really too low, check the following: Check differential pressure over oil separator. Replace separator when necessary. Check and replace compressed air filters (if installed). Compressor does not unload. Check if pressure switch is correctly set and working.

How do you maintain a rotary screw compressor?

Upgrade the compressor if necessary. Preventive maintenance is essential for minimizing downtime and extending the life of a rotary screw compressor. Key maintenance practices include: Regular Inspections: Conduct routine inspections to identify and address potential issues before they become significant problems.

How to prevent cold temperature when compressor is shutdown?

Consider prevailing wind to prevent cold temperature when the compressor is shutdown. Cold oil temperature in the radiator and sump can cause insufficient oil circulation due to high viscosity. Compressor discharge pressure is normal but the entire shop has low pressure. Low at the main line plant air header?
